

Grey: every other spot in a, and every spot where the gene was not detected in b-f. Outlines enclose that domain's annotated spots.

Genes come from Wilcoxon rank-sum on the ground-truth annotation, not from prior literature.

Marker criteria: $p_{\text{adj}} < 0.05$, detected in $\geq 60\%$ of the domain, and detected $\geq 2x$ as often inside the domain as outside it.

"45 of top 96 inside": of the 96 highest-expressing spots (96 = the domain's size), 45 are annotated to that domain. Chance level is the domain's share of the section, 0.2-2.8%.
